I'm trying to run a spring 5.0.6 app with a spring data rest, but it complains about the heap size. What is the best way to change this value? A: The default minimum heap size is 50MB for spring boot which seems to be too low When using Docker, you can tweak the configuration of the JVM so that it allocates less memory. This is done by either adjusting the flag -Xmx, or using an option to specify an environment variable to override the default JVM allocation (JAVA_OPTS, JVM_OPTS, or even SPRING_OPTS, although I am not sure how you would use that in a Spring Boot context). For example, I would probably set it in my Dockerfile like this: COPY my.jar /tmp RUN java -Xmx1024m -jar /tmp/my.jar And then in my Dockerfile: ENV JAVA_OPTS -Xmx512M The above settings will allow my app to allocate 512 MB of RAM for itself. The JAVA_OPTS variable in the Dockerfile will then override any default settings in the Docker image, so you might also want to consider moving it to the ENTRYPOINT statement. Erdogan: Russia could end up becoming a target after Crimea Turkish President Recep Tayyip Erdogan is warning that Russia could "one day" become a target for his country, as President Vladimir Putin delivers a defiant victory speech after sweeping to victory in a regional election. Mr Erdogan appeared to play on the divisions between Russia and Ukraine when he made the comments on Thursday. Ukraine's president has described the elections as a "political earthquake" as he appealed to Russians to rally around the new authorities in the

What's New in the AutoCAD?

A new Quick Markup feature helps you quickly incorporate feedback from printed paper or PDFs. Use AutoCAD's free Markup Assist tool to quickly create variable objects. Markup Assist will work with more file types than before, including shape files, PDFs, and 3D file formats. Use the new enhanced text-importing function to import and edit text as you work on the drawing. Model Fidelity Inference: Measure the accuracy of your models. Now you can compare 2D and 3D models to see if they are drawing the same thing, based on their structure. Create a drawing layer and check for differences automatically, without creating another drawing. Glyph Checking: Perform a user-defined glyph checking workflow to check model glyphs, such as for the creation of new model records. Polar Analysis: Now perform 2D and 3D polar analysis on shapes, like when you draw lines or detect 3D angles. To efficiently determine the 3D coordinates of points that lie on surfaces, you can now automatically determine the latitudinal and longitudinal coordinates from polar angles. 3D display improvements: You can now work with 3D in the 3D space and in parallel in 2D mode. You can now scroll through the axis window using the scroll wheel. When you use the next/prev or previous/next buttons in the Viewport toolbar, you'll see a tooltip describing the next or previous viewport. When you zoom in or out in the Viewport, you can see a tooltip describing the current viewport size. When you rotate a 3D viewport around the 3D x-, y-, and z-axes, a tooltip will describe the rotation angle in the corresponding 2D axes. 2D display improvements: A new set of icons and controls on the canvas floorplate makes it easier to select and manipulate objects. You can now control your camera position and change the camera type (including orthographic, isometric, etc.) using camera icons and controls on the floorplate. You can see the camera viewport and the vanishing points when you select a 3D object from the Viewport toolbar. When you select a 3D object and zoom out in the Viewport, you
